~~Differential Equations Applications — Significance and Types~~

In mathematics, a differential equation is an equation that relates one or more functions and their derivatives. In applications, the functions generally represent physical quantities, the derivatives represent their rates of change, and the differential equation defines a relationship between the two. Such relations are common; therefore, differential equations play a prominent role in many disciplines including engineering,

Like any other mathematical expression, differential equations (DE) are used to represent any phenomena in the world. One of which is growth and decay – a simple type of DE application yet is very useful in modelling exponential events like radioactive decay, and population growth.

In Science and Engineering problems, we always seek a solution of the differential equation which satisfies some specified conditions known as the boundary conditions. The differential equation together with the boundary conditions constitutes a boundary value problem.

~~Applications of Partial Differential Equations~~

Differential equations involve the differential of a quantity: how rapidly that quantity changes with respect to change in another. For instance, an ordinary differential equation in $x(t)$ might involve x , t , dx/dt , $d^2 x/dt^2$ and perhaps other

The differential equation is second order linear with constant coefficients, and its corresponding homogeneous equation is where $B = K/m$. The auxiliary polynomial equation, $r^2 - Br = 0$, has $r = 0$ and $r = -B$ as roots. Since these are real and distinct, the general solution of the corresponding homogeneous equation is

Differential equations have wide applications in various engineering and science disciplines. In general, modeling of the variation of a physical quantity, such as temperature, pressure, displacement, velocity, stress, strain, current, voltage, or concentration of a pollutant, with the change of time or location, or both would result in differential equations.

Ordinary Differential Equations (ODEs) An ordinary differential equation is an equation that contains one or several derivatives of an unknown function, which we usually call $y(x)$ (or sometimes $y(t)$ if the independent variable is time t).
