 Secondly, even within a single deformation, mechanisms and microstructures vary from mineral to mineral within a polymineralic rock: a common example is the intracrystalline plasticity of quartz in a shear zone at greenschist facies, that contrasts with cataclastic deformation of feldspar in the same conditions.

 Professor Bernard Grasemann, University of Vienna, Austria. "This book is a competent and useful description of deformation microstructures and mechanisms in minerals and rocks as studied by optical microscopy.... The final chapter , "From microstructures to mountains: deformation microstructures, mechanisms and tectonics", is perhaps somewhat anomalous in that it is significantly more quantitative and integrative and introduces the reader to how observations on the microscopic scale can be ...

 After introducing three main classes of deformation microstructures and mechanisms, low- to high-grade deformation is presented in a logical sequence in Chapters 2 to 5. Magmatic/submagmatic deformation, shear sense indicators, and shock microstructures and metamorphism are described in Chapters 6 to 8, which are innovative chapters in a structural geology textbook.

 Deformation mechanisms and microstructures. When strain accumulates in a deforming rock, certain deformation processes occur at the micro-scale that allow the rock to change its internal structure, shape or volume. The processes involved may vary and in the plastic regime there are other and different processes.

 Therefore, mechanical properties of WAAW alloys would be improved by the deformation strengthening mechanism after rolling, accompanying with distinct microstructures. The grain orientation, texture, grain sizes, and boundary misorientation angle distribution information were analyzed with EBSD and the CHANNEL 5 software.

 Typical deformation microstructures developed in the Cu-Cr-Zr alloy subjected to ECAP at 673 K to total strains of 1 (a), 2 (b), 4 (c), 8 (d) and 12 (e). The white and black lines indicate the low-angle (<15°) and high-angle (>15°) boundaries, respectively. The inverse pole figures are shown for the transverse direction (TD) of the ...

 Deformation mechanism refers to the various processes occurring at micro-scale that are responsible for changes in a material's internal structure, shape and volume. The process involves planar discontinuity and/or displacement of atoms from their original position within the crystal lattice system. These small changes are preserved in various microstructures of materials such as rocks, metals ...

 A sequence of deformation mechanisms was revealed under high rate and/or cryogenic sliding (strain rate $\approx 10^4$ s⁻¹; liquid nitrogen temperature): First, nanoscale dislocation trace lines form beneath the surface during the first forward pass; Second, partial dislocation nucleation from the sliding surface accompanied by nano-twinning and abundant stacking faults in the backward pass; Third, formation of a nanocrystalline layer upon further sliding. Sliding induced surface roughening is ...

 6. Microstructural mechanisms of fatigue crack initiation in low and high cycle fatigues. The sequence of cyclic deformation events sketched in figure 2 is typical of ductile metals and alloys. In cyclic saturation, a characteristic dislocation structure has developed in the bulk, and a pattern of slip traces or some sort of PSBs of highly localized slip is recognizable at the surface.

 We use detailed EBSD measurements to reconstruct microstructures that constrain the relative contribution of specific deformation mechanisms operating in different parts of an active salt fountain. In particular, we contrast the microstructures and interpreted mechanisms from the top of the extruded glaciers and the diapiric stem.

 In this work, the SEM/EBSD ex-situ observation of compression reveals the plastic deformation mechanism of fully lamellar, equiaxed and bimodal microstructures, which provide a fundamental understanding on the influence mechanism of microstructure on the mechanical properties. The main findings can be summarized as follows: (1)

 Here are some deformation maps for common minerals. (Davis & Reynolds Fig. 4.61) VDPM 09.34. VDPM 09.35. VDPM 09.36. These maps show the fastest deformation mechanism under given conditions of T and differential stress. Contours are drawn within the diagrams showing the strain rate predicted under those given conditions.

 Students match microstructures to the deformation mechanisms by which they form; compare pairs of photomicrographs chosen to highlight key differences between some common microstructures; and complete a self-quiz in which they identify microstructures and infer deformation mechanisms from photomicrographs.

 Deformation microstructure not only determines the properties of a deformed metal but also provides the driving force for recovery and recrystallization; recovery competes with recrystallization in restoring microstructure and properties and at the same time facilitates nucleation of recrystallization.
