quantum physics problems. In this article, we share MATLAB codes which have been developed at WPI, focusing on 1D problems, to be used in conjunction with Griffiths' introductory text. Two key concepts underpinning quantum physics are the Schrodinger equation and the Born probability equation. In 1930 Dirac introduced bra-ket notation for state

I want to simulate a circuit similar to the one below in MATLAB. If you have a state matrix describing the state of 3 qubits, I understand that you could apply a CNOT matrix tensored with an identity matrix to $|\psi_0\rangle$ to get $|\psi_1\rangle$, but if you want to apply a controlled operation to the 1st and 3rd qubit to get $|\psi_2\rangle$, how can you do this?

To this end, we found the Wave Packet open-source package of MATLAB [10-12], the tutorial 'Doing Physics with MATLAB', the introductory book Quantum Mechanics with MATLAB, and the Quantum Optics Toolbox of MATLAB. However, most of these does not have examples illustrating many-body effects in both closed and open quantum systems.

The Quantum Fourier Transform (QFT) uses normalized basis functions (unlike the classical Discrete Fourier Transform) to represent a discrete state vector: $|x\rangle = \frac{1}{\sqrt{N}} \sum_{j=0}^{N-1} e^{-2\pi i x j / N} |j\rangle$. As the basis is orthonormal, the QFT projections can be computed by the unitary transform: $QFT = \frac{1}{\sqrt{N}} \begin{pmatrix} \omega_0^0 & \omega_0^1 & \omega_0^2 & \omega_0^3 \\ \omega_1^0 & \omega_1^1 & \omega_1^2 & \omega_1^3 \\ \omega_2^0 & \omega_2^1 & \omega_2^2 & \omega_2^3 \\ \omega_3^0 & \omega_3^1 & \omega_3^2 & \omega_3^3 \end{pmatrix}$
