5. Online monitoring of steam and water chemistry in a steam system is important for safe and reliable operation of steam generators. High-pressure, high-temperature steam is a critical commodity at power plants and at many chemical process industries (CPI) facilities. Examples abound in heavy industry, where co-generation facilities are common. In these plants, a portion of the steam generated is utilized to drive power-generating turbines, while the remainder is used for other turbine ...

A heat-recovery steam generator (HRSG) is a type of heat exchanger that recovers heat from a hot gas stream and produces steam (Figure 1). The steam can be used in a process or used to drive a steam turbine for electricity production. You might choose an HRSG if your plant is generating electricity via a gas turbine generator.

2019-10-13 · Boilers are used to produce steam. The generation part of a steam system uses a boiler to add energy to a feedwater supply to generate steam. The energy is released from the combustion of fossil fuels or from process waste heat. Where are Boilers Used? Anywhere you are creating heat and/or steam, you will probably find a boiler.
