Cost estimation may be defined as the process of forecasting the expenses that must be incurred to manufacture a product. These expenses take into consideration all expenditures involved in design and manufacturing with all the related service facilities such as pattern making, tool making as well as portion of the general administrative and selling costs.

As a rough average, land costs for industrial plants amount to 4 to 8 percent of the. These design guideline are believed to be as accurate as possible, but are very general and not for specific design cases. They were designed for engineers to do preliminary designs and process specification sheets.

Process Equipment Cost Estimating by Ratio and Proportion

In general, it is not practical or cost-effective to use IPE for the assessment of cost estimates contained in proposals for novel processes or in generating rough cost estimates from laboratory scale data. Instead, the factored estimation methodology, a cost-effective methodology widely used in industry, is more suitable for that application.

General Process Plant Cost Estimating Engineering

While the Lang factors are quite old, they are still useful for checking estimates of process plant construction costs. Lang predicted total plant construction cost based upon the delivered cost of plant equipment. The factors are 3.1 for solids processing plants (a coal preparation plant for example) 3.63 for a solid-fluids process plant (a coal gasification plant would be an example) 4.74 for a fluids processing plant (such as an oil refinery).

B.2.2 Overview of the Cost Estimating Process Traditionally, cost estimates are produced by gathering input, developing the cost estimate and its documentation, and generating necessary output. Table B-1 explains the GAO cost estimating process steps that should be followed if accurate and credible cost estimates are to be developed.
