Rover V8 – the Story of the Engine tells the fascinating story of the engine that created a legend in its own lifetime. Starting life as a General Motors design in 1961, but withdrawn three years later in favour of cheaper technology, it reached Rover by chance in the mid-1960s. Few

other British companies then had V8 engines in production, and Rover immediately gained a special status when the V8 entered UK production during 1967. This was an extraordinarily compact design and also extraordinarily light, thanks to its all-aluminium alloy construction. It was not a temperamental high-performance engine, but had a well-proven and simple architecture that made it both reliable and easy to work on. Small wonder, then, that the Rover V8 was bought by sports car makers who needed a light, compact and powerful engine. Small wonder that Rover kept it in production for so long, developing multiple different sizes and versions. Small wonder that the engine is still revered by Rover and Land Rover enthusiasts today, or that its popularity as an aftermarket conversion has ensured that it remains in small-volume production, half a century after entering production in the UK.

As the combustion engine looks set to remain the dominant energy conversion unit in vehicle powertrains in the medium term, either in combination with electrical components or on its own, attention will need to be paid to continue improving its efficiency in the future. The high development depth of today's combustion engines means that it is becoming increasingly difficult to achieve significant efficiency improvements by simple means. On the search for these improvements, the focus has shifted to inner-engine processes, for instance charge cycles including the charging system, the mixture formation including injection, combustion and kinematic conversion

of the energy within the fuel. Our 2nd conference 'Engine processes' aims to offer all developers a platform to discuss the latest technological developments in the field of inner-engine process control, and encourage new paths to be taken. We believe that the program for this conference is a sound foundation for this endeavour. Da der Verbrennungsmotor auch mittelfristig die dominierende Energiewandlungseinheit im Antriebsstrang von Kraftfahrzeugen sein wird, entweder im Verbund mit elektrischen Komponenten oder aber als alleiniger Antrieb, muss der Verbesserung von dessen Wirkungsgrad auch in Zukunft erhebliche Aufmerksamkeit zu Teil werden. Aufgrund der hohen Entwicklungstiefe, die heutige Verbrennungsmotoren aufweisen, wird es immer schwerer, deutliche Wirkungsgradverbesserungen auf einfachem Weg zu erreichen. Auf der Suche nach diesen Verbesserungen rücken die innermotorischen

Prozesse immer mehr in den Fokus, hierzu zählen der Ladungswechsel inkl. Aufladesystem, die Gemischbildung inkl. Einspritzung, die Verbrennung sowie die kinematische Wandlung der im Kraftstoff gebundenen Energie. Unsere 2. Tagung „ Motorische Prozesse “ soll nun allen Entwicklern als Austauschforum zu neuesten technologischen Entwicklungen auf dem Gebiet der innermotorischen Prozessführung dienen und dazu anregen neue Wege zu beschreiten. Wir sind überzeugt, mit dem vorliegenden Tagungs-Programm hierzu einen sehr guten Beitrag leisten zu können.
