Pediatric Pharmacotherapy 1st Edition. Pediatric Pharmacotherapy focuses on the unique therapeutic needs of neonates, infants, children, and adolescents. Patients in these age groups offer challenges distinct from those of adult patients. Drugs behave differently in this population—medications may not be absorbed, distributed, metabolized, or eliminated in the same manner as in adults, causing increased or decreased efficacy or safety.

The treatment of children with medicinal products is an important scientific area. It is recognized that many medicines that are used extensively in pediatric patients are either unlicensed or off-label. This textbook will help pediatric health professionals effectively treat children with the most appropriate medicine with minimal side effects.

The aim of this text is to examine the physiological development of the fetus. It allows the reader to study the unique pharmacokinetic and metabolic features of newborns and gives specific examples of drug metabolism in the newborn. The purpose of this book is to enhance the current knowledge of pharmacology of the newborn by observing the embryo and placenta in normal and abnormal development, placental transfer of drugs, metabolic pathways, and metabolism of specific drugs such as theophylline, benzodiazepines, and antibiotics. This is a useful book for those involved in pediatric research, pharmacology, toxicology, experimental therapeutics and biology.

The premier comprehensive textbook in the field, Yaffe and Aranda's Neonatal and Pediatric Pharmacology, Fifth Edition, provides an authoritative overview of all aspects of drug therapy in newborns, children, and adolescents. It offers evidence-based guidelines for safe, effective, and rational drug therapy, including specific recommendations for all major drug classes and diseases. Now in a vibrant two-color format, this fully revised reference is an indispensable resource for pediatricians, neonatologists, pediatric residents, and fellows in different pediatric subspecialties, including neonatal medicine and pediatric critical care.

Pediatric Primary Care Case Studies is a collection of pediatric case studies of common health problems of well, acutely ill, and chronically ill children. This text provides students with the opportunity to assess the scenario, differential diagnoses, treatment and educational plans. The cases include history and physical examination data and provide suggested case solutions. The cases include developmental, behavioral, and disease problems written to include family, cultural, and other contextual issues which must be considered to provide optimal care. Current guidelines and evidence-based research are used to support the care recommendations. Pediatric Primary Care Case Studies provides realistic ambulatory care cases that allows students to develop their critical thinking skills as they work through common situations faced by health care providers.

The Textbook of Interdisciplinary Pediatric Palliative Care, by Dr. Joanne Wolfe, et al., aims to inform interdisciplinary teams about palliative care of children with life-threatening illness. It addresses critical domains such as language and communication, symptoms and quality of life, and the spectrum of life-threatening illnesses in great depth. This comprehensive product takes a first-of-its-kind team approach to the unique needs of critically ill children. It shows how a collaborative, interdisciplinary care strategy benefits patients and their families. If you deal with the complex care of critically ill children, this reference provides a uniquely integrated perspective on complete and effective Apply interdisciplinary perspectives to provide the most comprehensive care. Care for patients and their families with an integrated approach designed to address physical, psychological, social, and spiritual needs. Focus on the self-care of clinicians in order to be more expert in direct patient care. Understand the importance of linking community palliative care with hospital-based palliative care. Access the full text online with regular updates along with a host of valuable resources such as education modules, research articles, patient handouts, and audio/visual materials. Implement consistent terminology for use by the entire palliative care team. Reflects the collaborative approach necessary to provide optimal care for children and their families

Dr. Aranda is an top expert in the area of pharmacology in the pediatric population. His issue has knowledgeable authors presenting clinical reviews on a wide variety of topics, from "hot areas " of drug therapy to drug abuse in children as well as current areas of debate in neonatal drug therapy. Articles are devoted to the following topics: New and Current Drug Therapies For Asthma In Children; Psychopharmacology Of Bipolar Disorders in Children and Adolescents; Designer Drug Abuse in School Children; Dietary Supplements in Children; Anticoagulant Therapies in Children; New Antimicrobials for Gram-Positive Infections in Children; Probiotics in Newborns And Children; Anticonvulsant Therapies in Newborns and Children; Immunomodulator Drug Therapies in Inflammatory Bowel Diseases in Children; Non-Steroidal Anti-Inflammatory Drugs in Newborns and Children; Metformin Use in Pre-Diabetic Children and Adolescents; Problems in Drug Dosing of Obese Children; Inhaled Drugs and Systemic Steroids for Bronchopulmonary Dysplasia; Antifungal Drugs in Newborns and Children; Antiviral Drugs In Newborns and Children; and Development of Drug Therapies for Newborns and Children. Readers will come away with the latest clinical information to help inform them when diagnosing and prescribing for children.

The objective of this volume is to give an overview of the present state of the art of pediatric clinical pharmacology including developmental physiology, pediatric-specific pathology, special tools and methods for development of drugs for children (assessment of efficacy, toxicity, long-term safety etc.) as well as regulatory and ethical knowledge and skills. In the future, structural and educational changes have to lead back to a closer cooperation and interaction of pediatrics with (clinical) pharmacology and pharmacy.

Pharmacology is fundamental for therapeutics. This is well recognised in the field of internal medicine, for which pharmacological textbooks abound. Paediatric pharmacology however, has largely been viewed as a subsection of general medicine. This is incorrect: it should be seen as a separate and important entity. This book is written from the viewpoint of a paediatrician, but it is addressed to all who have responsibility for the care of children, particularly physicians and pharmacists. As the latter may lack familiarity with certain diseases of children, I have added a clinical appendix in certain pertinent areas. My approach in each chapter has been to show the interdependence of physiology and pharmacology. Thus I make no apology for providing a physiological review for most topics. Each chapter is reasonably self-contained. I have presumed that a majority of readers will most often go directly to that section relevant to their immediate requirements, and therefore I have sometimes had to restate important points in more than one place. Nevertheless, for the cover to-cover reader, there will not be an excess of repetition. Since this is not a textbook of adult therapeutics, there will be no discussion of such things as coronary vasodilators. Likewise, the obstetric pharmacology of parturition has been omitted, although I have thoroughly covered the pharmacological problems of the fetus and the infant. I am greatly obliged to generations of my students, both under graduate and postgraduate.

"Neonatal and Pediatric Pharmacology offers guidelines for safe, effective, and rational drug therapy in newborns, children and adolescents. The book provides relevant and useful data on the molecular, physiologic, biochemical, and pharmacologic mechanisms of drug action and therapy in this population. The authors identify areas of innovative basic and translational research necessary for the continuing evaluation and development of drugs for the fetus, newborns, children and adolescents. Neonatal and Pediatric Pharmacology is is a valuable reference for all health care professionals who treat the fetus, newborns, children, and adolescents, including neonatologists, nurses, pediatricians, general practitioners, students, obstetricians, perinatologists, surgeons and allied health professionals. It will be useful anytime during the day and especially in the middle of the night when knowledge of appropriate indications, safe and effective use, dosage, and therapeutic regimen for a certain drug or molecular entity is immediately needed. The book is also directed to those involved in basic, clinical, and other academic pharmacological research, the pharmaceutical industry, and regulatory agencies dealing with drug and therapeutic developments for this population. Those teaching pharmacology and therapeutics will find this compilation of information extremely useful in preparing teaching materials"--Provided by publisher.
