En revanche, celui de la pente est important. En effet, ce n'est pas parce que le coefficient de la pente est fort qu'il est significativement différent de 0. La significativité de la pente dépend de la dispersion des points autour de la droite de régression. C'est donc le niveau de la p-value qui va permettre de trancher.

Aggression in Global Perspective attempts to present both an elucidating and a utilitarian picture of aggression in global perspective: elucidating, in that it serves to help deepen the understanding of the meaning and nature of aggression throughout the world; utilitarian, in that its companion focus on aggression controls and alternatives in global perspective actually functions to aid the constructive, prosocial, anti-aggression efforts which do exist, or might exist, to more readily and more fully succeed. The book begins by drawing upon individual cultural perspectives on aggression, aggression control, and aggression alternatives to offer a more unified, global perspective. It compares, contrasts, distills differences and similarities, and suggests specific directions for future research and applied efforts at better understanding of aggression. The chapters which follow describe contemporary manifestations of aggression in a large number of nations representing almost the entire world. These descriptions are placed in a cultural context, providing an understanding of why, for the given country or region, aggression currently assumes particular forms, rates, and intensities. Such contextual information is also utilized in most of the ensuing chapters to aid in understanding how aggression "fits in" or is conceptualized in each nation's stream of daily living.

This book provides a broad and contemporary overview of aggression and violence by some of the most internationally renowned researchers in the field. It begins with an integrative theoretical understanding of aggression and shows how animal models shed light on human aggression and violence. Individual risk factors for aggression and violence from different research perspectives are then examined. First, there is a cognitive neuroscientific, neuropsychological, and psychophysiological study of the brain. It then explores the developmental psychological factors in aggressive behavior, incorporating work on gender and the family. Other perspectives include the role of testosterone, individual differences, and whether humans are innately wired for violence. The following sections moves from the individual to the contextual risk factors for aggression, including work on the effects of adverse events and ostracism, guns and other aggressive cues including violent media, and drugs and alcohol. Targets of aggression and violence are covered in the next section, including violence against women and loved ones; aggression between social groups; and the two very contemporary issues of cyberbullying and terrorism. The book concludes with work showing how we may make the world a more peaceful place by preventing and reducing aggression and violence. The volume is essential reading for upper-level students and researchers of psychology and related disciplines interested in a rigorous and multi-perspective overview of work on aggression and violence.

Statistical Learning from a Regression Perspective considers statistical learning applications when interest centers on the conditional distribution of the response variable, given a set of predictors, and when it is important to characterize how the predictors are related to the response. As a first approximation, this is can be seen as an extension of nonparametric regression. Among the statistical learning procedures examined are bagging, random forests, boosting, and support vector machines. Response variables may be quantitative or categorical. Real applications are emphasized, especially those with practical implications. One important theme is the need to explicitly take into account asymmetric costs in the fitting process. For example, in some situations false positives may be far less costly than false negatives. Another important theme is to not automatically cede modeling decisions to a fitting algorithm. In many settings, subject-matter knowledge should trump formal fitting criteria. Yet another important theme is to appreciate the limitation of one's data and not apply statistical learning procedures that require more than the data can provide. The material is written for graduate students in the social and life sciences and for researchers who want to apply statistical learning procedures to scientific and policy problems. Intuitive explanations and visual representations are prominent. All of the analyses included are done in R.

Since the Nuremberg trial, the crime of aggression has been considered

one of the gravest international crimes. However, since the 1940s no defendants have been charged with this crime, with some states actively opposing the notion of punishing aggression. The option of trying an individual for aggression is expressly included in the statute of the International Criminal Court. In 2010 the Assembly of States Parties adopted a definition of the crime of aggression and conditions of the exercise of jurisdiction over this crime by the Court. The Assembly also agreed that the decision on including the crime of aggression within the Court's jurisdiction would be made in 2017 at the earliest. It is still internationally debatable whether the criminalisation of aggression is an outcome to strive for, or whether its abandonment is more preferable. In *Criminal Responsibility for the Crime of Aggression*, Patrycja Grzebyk explores the scope of criminal responsibility of individuals for crimes of aggression and asks why those responsible for aggression are not brought to justice. The book first works to identify the legal norms that define and delegalise aggression, before moving to determine the basis and scope for the criminalisation of aggression. The book then goes on to identify the key risks and difficulties inherent in trials for aggression. Following a string of awards in Poland, including the Manfred Lachs Prize for the best first book on public international law, this cutting investigation of aggression is now deservedly made available to the wider world. In its extensive analysis of international trials on aggression, and its synthesis of legal, political and historical rhetoric, this book offers broad and striking insight into the criminal responsibility of individuals on a world stage.

Unchecked aggression and violence take a significant toll on society. Even if we manage to avoid being the direct victim of a violent act, the effects of aggression and violence reach us all: We hear about the mauling of a woman by an aggressive dog, our children are bullied at school, or we deal with impulsive violence while commuting to work or attending a sporting event. Reflecting psychology in general, the dominant roles of learning and environmental influences - both social and nonsocial - have traditionally been prominent in discussions of the etiology of human aggression. Biological factors have not been considered sufficiently important to investigate in the search for ways of dealing with human aggression or violence. With recent advances in pharmacology and genetic manipulation techniques, however, new interest has developed in the biological mechanisms of both non-human and human aggression. Although aggression is certainly a complex social behavior with multiple causes, molecular biological factors should not be overlooked, as they may well lead to interventions that prevent excess aggressive behaviors. The primary goal of this book is to summarize and synthesize recent advances in the biological study of aggression. As most aggressive encounters among human and non-human animals represent a male proclivity, the research in this book describes and discusses studies using the most appropriate murine model: testosterone-dependent offensive inter-male aggression, which

is typically measured in resident-intruder or isolation-induced aggression tests. The research also emphasizes various molecules that have been linked to aggression tests. The research also emphasizes various molecules that have been linked to aggression by the latest gene-targeting and pharmacological techniques. Although the evidence continues to point to androgens and serotonin (5-HT) as major hormonal and neurotransmitter factors in aggressive behavior, recent work with GABA, dopamine, vasopressin, and other factors, such as nitric oxide, has revealed significant interactions with the neural circuitry underlying aggression. This book is organized according to levels of analysis. The first section examines the genetic contributions to aggression in species ranging from crustaceans to humans. The section summarizes the involvement of various neurotransmitters and neuromodulators in aggressive behavior. The third section summarizes the influence of hormones on aggression, primarily in humans. All chapters emphasize future directions for research on aggression and reveal important domains that have received comparatively less attention in this literature. Considered together, these chapters provide up-to-date coverage of the biology of aggression by some of the leading authorities currently working in this field. *Biology of Aggression* will direct future research to continue the recent advances in the pharmacological and genetic approaches to understanding aggression and violence. It promises to be a valuable resource for professional and student researchers in neuroscience, psychiatry, cognitive and developmental psychology, behavioral biology, and veterinary medicine.

As the Solutions Manual, this book is meant to accompany the main title, *Introduction to Linear Regression Analysis, Fifth Edition*. Clearly balancing theory with applications, this book describes both the conventional and less common uses of linear regression in the practical context of today's mathematical and scientific research. Beginning with a general introduction to regression modeling, including typical applications, the book then outlines a host of technical tools that form the linear regression analytical arsenal, including: basic inference procedures and introductory aspects of model adequacy checking; how transformations and weighted least squares can be used to resolve problems of model inadequacy; how to deal with influential observations; and polynomial regression models and their variations. The book also includes material on regression models with autocorrelated errors, bootstrapping regression estimates, classification and regression trees, and regression model validation.

relationships with peers, with later romantic partners, and with their own children. Key issues addressed include the predictors of social and physical aggression at different points in the lifespan, connections between being a victim and a perpetrator, and the interplay of biological and sociocultural processes in shaping aggression in girls. Concluding commentaries address intervention, prevention, juvenile justice, and related research and policy initiatives.

Adopting a unique situation-oriented perspective, this book studies the occurrence and control of aggression on the micro-, meso-, and macro-levels of physical and social ecologies. The wide ranging viewpoint clarifies important aspects of all forms of aggression to provide psychologists, sociologists, and criminologists with a powerful aid for treatment and intervention techniques.
