~~NHS~~

Surgery and radiotherapy are both highly active treatment modalities, and the cure rate ranges from 30-95% depending on stage and site of disease. The natural history of predominantly localised disease, and the radiosensitivity of the majority of head and neck cancers make radiotherapy an attractive and important curative modality of treatment.

Malnutrition: Nearly all of the side effects of radiation therapy for head and neck cancer may contribute to malnutrition. If possible, work with a nutritionist to select healthy food and drink choices that are digestible. If simple suggestions to treat malnutrition aren't enough, you may need a feeding tube, which will require a hospital stay.

~~The Troubling Side Effects of Head &
Neck Radiation ...~~

Radiotherapy for head and neck cancer is broadly classified into two types, namely, external irradiation and brachytherapy. External irradiation is most commonly employed. It generally involves the use of linear accelerators that direct X-ray and/or electron

Most patients who have radiation or chemotherapy for oral, head and neck cancer will develop mouth and throat sores at some point during their treatment. This condition is called oral mucositis. The surface of the mouth and throat are made up of epithelial cells, which are a type of cells that grow and divide quickly.
